

## PRESS RELEASE

### Andcosta at Light+Building 2022 Frankfurt

Andcosta presents its new collection at Light+Building 2022 Frankfurt.

The stand's black and red concept encapsulates the company's technical expertise, the defining element of the new products, which arise out of the intuition and imagination of the Andcosta design team and founder Carlo Zerbaro.

The 5 exhibition spaces of the stand showcase innovations of a professional and architectural nature, in the refreshed looks of iconic products such as Circus Round, Circus Acoustic Panel, Grue, and in the new families of product such as B-Pro, Daytona, and Cyl.

Our sales team will show you how to create excellent lighting, adapting it to your needs, and how simple and creative the process of customising your space can be achieved with the new B-PRO and DAYTONA products, a range of devices that can be configured for any lighting requirement and with long-lasting light sources.

#### B-PRO

Both the BASIC and SYSTEM versions are minimalist in style, yet they offer endless configuration options, merging technology with architecture through light.

The B-PRO line defines space by tracing elegant geometries that float in space.

The minimalist body is the essence of multiple lighting and configuration possibilities, especially thanks to the use of an articulation which when anchored to different surfaces, in the SYSTEM version, enables the creation of unique geometries, characterising the architecture with signature lighting.

Individual ultra-fine optical systems provide very sharp direct and indirect light.

The SYSTEM version gives you the option to use diffusers according to your needs: an opalescent filter for more diffuse light or a dark-light optic which, thanks to its thin grid, sections the light beam of the high-efficiency LED into miniature alveoli, drastically reducing glare and improving visual comfort. The dark-light optic, for direct light, is suitable for workstations with screens. Alternately, directing light with an opal diffuser on the indirect side dissolves the light emission, giving even lighting over the wall/ceiling.

B-PRO is equipped with a highly reliable light source with a CRI 90 value available in all colour temperature variants providing users with a wide choice for their environment.

#### DAYTONA

DAYTONA is based on a track concept and is transformed by creating lightscapes that can be modulated according to the user's needs. Versatile and minimalist in design, DAYTONA is constantly evolving its suspension and ceiling versions.

All it takes are simple actions to arrange a customised, creative configuration to suit your environment. In offices, as in hospitality structures, retail and public spaces, the outstanding characteristic of DAYTONA is its ability to integrate linear and circular elements with different technologies, optics, finishes, and sizes.

Daytona is equipped with a highly reliable light source with a CRI 90 value available in all colour temperature variants providing users with a wide choice for their environment.

#### CYL

CYL, the new range of spotlights designed for the low-voltage multisystem track system, for ceiling and wall installation, to create the perfect accent lighting for home, retail, hospitality, and museum environments.

CYL dialogues with the architecture through its various versions, with options of power, light output, and narrow, medium, and wide beam optics.  
CYL spots are equipped with a high-quality LED light source featuring a high colour-rendering index. Refined finishes highlight its aesthetic aspects.

We look forward to seeing you in Frankfurt to show you our lighting solutions!  
From 2 to 6 October, Hall 3.1 Stand B71  
See you soon!
